Dear Hiring Manager,

I am excited to apply for the Backend Software Engineer role at Clear. As a computer science graduate student at Arizona State University, I am passionate about programming and have a strong desire to contribute to innovative applications.

I am well-versed in multiple programming languages like Java, Python, and PHP. I have worked as a software developer for 3 years. First at Autoninja, a startup that developed CRM and analytics tools tailored for auto dealerships, then at ICICI Lombard General Insurance Company – one of the largest insurance companies in India, where I led a team of 3 developers tasked with building a mobile-first customer portal using microservices written in Python and Laravel/Lumen. As a part of university coursework, I have worked on multiple projects in Java, Scala, and Python. Notably, I built an end-to-end data processing pipeline using Apache Spark, Hadoop, and neo4j for my Data Processing at Scale course.

Apart from my professional experience and coursework, I have worked on multiple personal projects to further hone my skills while building practical and useful tools.

I am a quick learner and have a strong desire to continue growing my knowledge of new technologies and programming languages. I believe that working as a software developer at Clear will allow me to learn from experienced developers, contribute to exciting projects, and improve my programming skills.

Thank you for considering my application. I am eager to discuss how I can contribute to your team as a software engineer.

Sincerely,
Adhip Kashyap
